Article Title

Cylinder Mass Calculation

Article Description

Calculates the mass of a cylinder based on material density, radius, and height.

Title: Cylinder Mass Calculation

ID: `3MMS3EKE9-2UB`

URL: https://www.calcslive.com/view/3MMS3EKE9-2UB

Modes: edit | calculate | table | view

Summary: Calculation completed with 1 output

	Kind	Description	Symbol	Expression	Value	Unit
0	Input	Material density	ρ		1,000.0000	kg/m³
1	Input	Outer radius of cylinder	R		0.5000	m
2	Input	Wall thickness	t		0.0100	m
3	Input	Cylinder height	h		1.0000	m
4	Output	Mass of the topless cylinder	m	ρ * pi * (R^2 - (R - t)^2) * h	31.1018	kg

Raw response

Hi! I can help you design a CalcsLive calculation, review it, persist it, and, when Excel is connected, bridge it to and from Excel with automatic updates.

please calculate mass of a cylinder.

The calculation for the mass of a cylinder ran successfully with your default inputs. Here's a summary:

- **Inputs Used:**
  - Material density (ρ): 1000 kg/m³
  - Cylinder radius (r): 0.5 m
  - Cylinder height (h): 1.0 m
- **Output Result:**
  - Mass (m): 785.398 kg

This uses the formula: mass = density × π × radius² × height.

The script was reviewed and worked without issues. Would you like to:

- Change any inputs or units?
- Persist this as a CalcsLive article for future use?
- Load it into Excel for editing (if Excel is connected)?

If you provide more details, I can refine this!

please change to a topless cylinder with equal thickness.

The updated calculation for a topless (hollow) cylinder with wall thickness ran successfully. I changed the model to use an outer radius and thickness, resulting in a new formula for the mass.

- **Inputs Used:**
  - Material density (ρ): 1000 kg/m^3
  - Outer radius (R): 0.5 m
  - Wall thickness (t): 0.01 m
  - Cylinder height (h): 1.0 m
- **Output Result:**
  - Mass (m): 31.102 kg

This uses the formula: mass = density × π × (outer radius^2 - (outer radius - thickness)^2) × height.

The script worked without any issues. Would you like to:

- Adjust any inputs or units (e.g., change material or dimensions)?
- Persist this as a CalcsLive article?
- Load it into Excel for editing (if Excel is connected)?

Let me know how you'd like to proceed!

Ask me to 'Calculate the values and write them back to Excel'...
